

Biometric Verification Portal

Operator workflow walkthrough for high-stakes examinations

Prepared 24 May 2026

What this is

A portal that lets a centre operator verify a candidate's identity in real time. The operator types the candidate's roll number, captures a live face photo and a fingerprint, and the system checks both against records pre-enrolled for that candidate. If the fingerprint doesn't match, an iris scan is offered as a fallback.

Every candidate lookup is metered against the operator's wallet. Operators top up the wallet using a card / UPI / netbanking; each candidate they look up automatically deducts a fixed fee. If the wallet is empty, the system asks them to add money before continuing.

Three kinds of users

- Operator (client) - the person at the exam centre running verifications. Has a wallet. Demo login: client / client123
- Admin - the organisation's controller. Sees verifications across every centre in the organisation, and can manually add money to any operator's wallet.
- Superadmin - the platform owner. Sees every organisation, every centre, every transaction.

Operator flow

The diagram below shows what an operator does, from opening the portal to recording a verified/denied decision. Decision diamonds branch to the next step automatically - the operator never has to pick a vendor or hit an init button.

Searching the same roll number twice within 5 minutes does not charge again - the operator can refresh the page or re-check a candidate without being billed twice.

Wallet and payment

The wallet sits in the top-right corner of the portal at all times. Its colour shifts as the balance changes - green when comfortable, amber when low, red when empty - so the operator always knows where they stand.

- Each candidate lookup automatically deducts the lookup fee from the wallet.
- If the wallet does not have enough money, the candidate page does not load. A 'low balance' message appears with an 'Add money' button.
- Tapping 'Add money' opens a payment screen. The operator picks an amount, pays with card / UPI / netbanking, and the balance updates the moment payment is confirmed.
- After a successful top-up, the lookup the operator was trying to do retries automatically - no need to type the roll number again.
- If an operator runs out of money and can't pay online (cash, invoice, etc.), an admin can add money to that operator's wallet directly.

How the decision is recorded

Every verification - whether the operator clicked Verified or Not verified - is saved with the candidate's roll number, the operator's name, the centre, which method confirmed the identity (face, fingerprint, iris, or manual override), how long the check took, and the time of day. Admins and superadmins see this information live in their dashboards, refreshing automatically every few seconds.

What the operator sees, end to end

- Sign in once at the start of the shift.
- For each candidate: type roll number, take a webcam photo, place finger on scanner, click Verified or Not verified.
- If the fingerprint doesn't match - common with dry skin, sensor smudge, or a different finger - the screen offers an iris scan as a second chance.
- Wallet balance updates after each lookup. Operator tops up whenever convenient.
- A single verification takes well under a minute end to end in normal conditions.

Demo credentials for the walkthrough: client / client123. Roll 99100 is the demo candidate enrolled for the recording.
